Constraint Lifecycle Taxonomy

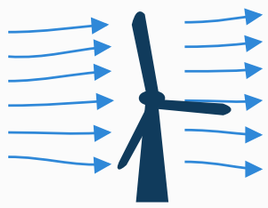

Five orthogonal dimensions for auditing physics-constrained forecasting studies

D1 Parameter Provenance

Where does the constraint originate?

Intrinsic

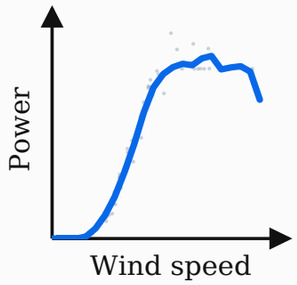

Governing laws / physical limits

$C_p \leq 16/27$

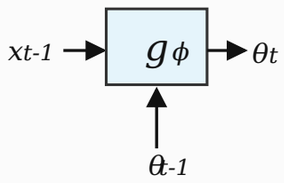

Historical-static

Offline SCADA-derived prior

Learned-online

Adaptive learned parameters

online update

Unreported

Provenance unspecified

provenance: — not specified

D2 Application Stage

Where does physics enter the forecasting system?

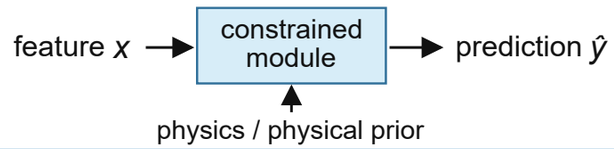

Training loss

Physics term in objective function

$$\mathcal{L} = \mathcal{L}_{task} + \lambda \mathcal{L}_{phys}$$

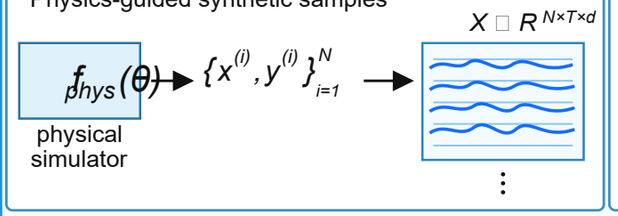

Architecture

Physics-constrained layer / graph

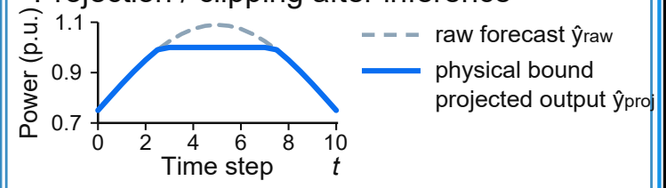

Data generation

Physics-guided synthetic samples

Post-hoc correction

Projection / clipping after inference

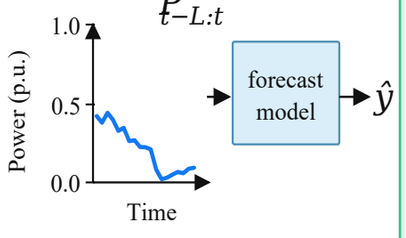

D3 Inference Telemetry Requirements

What external information is required at deployment?

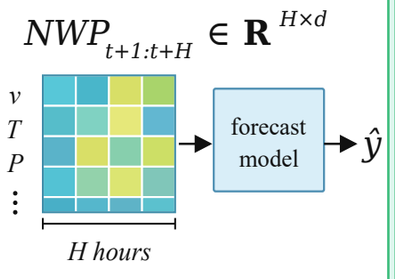

None

Historical target SCADA

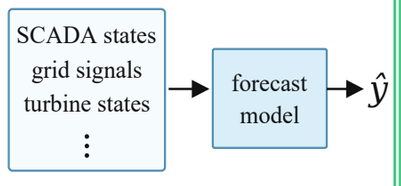

Forecast input

Future NWP

Contemporaneous state

Synchronized external measurements

D4 Implementation Fidelity

Can the published formulation be verified in executable code?

Code availability

Public

Source code available

loss.py
model.py
⋮ return $\mathcal{L}_{phys}$

Not found

No accessible source code

code: not available

Equation–code parity

If code is public, evaluate equation–code parity

Published equation	Source code	Aligned	Mismatch
$\mathcal{L}_{pub}(\theta)$	$\mathcal{L}_{exec}(\theta)$	Executable implementation matches formulation: $\mathcal{L}_{pub}(\theta) = \mathcal{L}_{exec}(\theta)$	Discrepancy between formulation and code: $\mathcal{L}_{pub}(\theta) \neq \mathcal{L}_{exec}(\theta)$

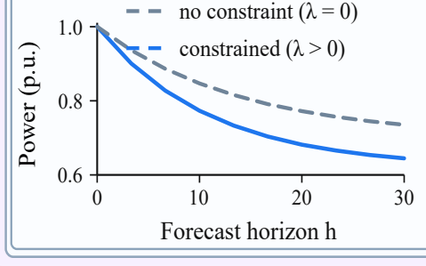

D5 Evaluation Validity & Harm Reporting

Does the evaluation isolate the physical prior and expose failure regimes?

Ablation semantics

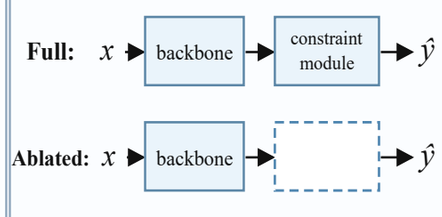

Constraint on/off

Identical backbone; $\lambda = 0 \leftrightarrow \lambda > 0$

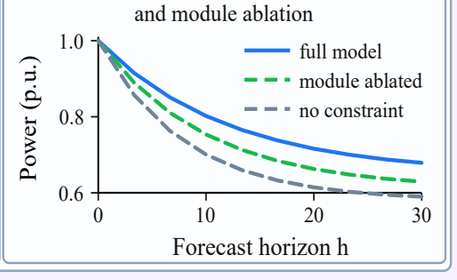

Module ablation

Full model ↔ neural block removed

Both

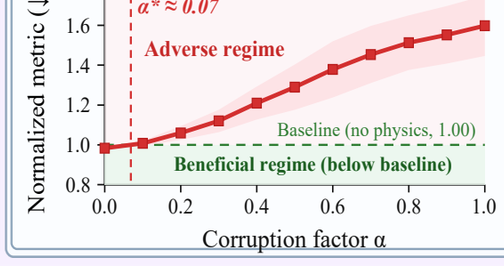

Constraint on/off and module ablation

Failure / harm reporting

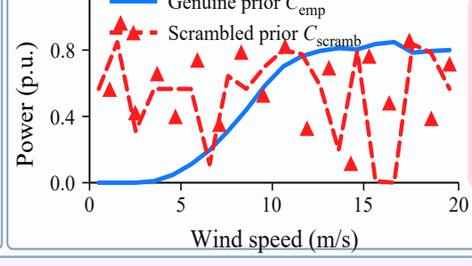

Reported

Degradation or failure boundary disclosed

Not reported

No adverse regime documented

Downstream decision-risk exposure not evaluated (failure boundary omitted)
